=> (10 20 30)
```

[top](#)

### \*

```
(*)  
(* x)  
(* x y)  
(* x y & more)
```

Returns the product of numbers. (\*) returns 1

```

## +

```
(+)  
(+ x)  
(+ x y)  
(+ x y & more)
```

Returns the sum of the numbers. (+) returns 0.

```
(+)  
=> 0  
  
(+ 1)  
=> 1  
  
(+ 1 2)  
=> 3  
  
(+ 1 2 3 4)

```

[top](#)

## -

```
(- x)
```

```
(- x y)
(- x y & more)
```

If one number is supplied, returns the negation, else subtracts the numbers from x and returns the result.

```
(- 4)
=> -4

(- 8 3 -2 -1)
=> 8

(- 5I 2I)
=> 3I

(- 8 2.5)
=> 5.5

(- 8 1.5M)
=> 6.5M
```

[top](#)

[-<>](#)

```
(-<> x & forms)
```

Threads the x through the forms. Inserts x at position of the <> symbol of the first form, making a list of it if it is not a list already. If there are more forms, inserts the first form at position of the <> symbol in second form, etc.

```
(-<> 5
  (+ <> 3)
  (/ 2 <>)
  (- <> 1))
=> -1
```

## agent

(agent state & options)

Creates and returns an agent with an initial value of state and zero or more options.

Options:

- :error-handler handler-fn
- :error-mode mode-keyword
- :validator validate-fn

The handler-fn is called if an action throws an exception. It's a function taking two args the agent and the exception. The mode-keyword may be either :continue (the default) or :fail The validate-fn must be nil or a side-effect-free fn of one argument, which will be passed the intended new state on any state change. If the new state is unacceptable, the validate-fn should return false or throw an exception.

```
(do
  (def x (agent 100))
  (send x + 5)
  (sleep 100)
  (deref x))
=> 105
```

## SEE ALSO

### [send](#)

### SEE ALSO

[or](#)

Ors the predicate forms

[not](#)

Returns true if x is logical false, false otherwise.

[top](#)

## any-pred

```
(any-pred p1 & p)
```

Takes a set of predicates and returns a function f that returns the first logical true value returned by one of its composing predicates against any of its arguments, else it returns logical false. Note that f is short-circuiting in that it will stop execution on the first argument that triggers a logical true result against the original predicates.

```
((any-pred number?) 1)
=> true

((any-pred number?) 1 "a")
=> true

((any-pred number? string?) 2 "a")
=> true
```

[top](#)

## any?

```
(any? pred coll)
```

Returns true if the predicate is true for at least one collection item, false otherwise.

```
(any? number? nil)

(any? number? [])
=> false
```

```
(any? number? [1 :a :b])

(any? #(== % 10) [10 20 30])
=> true

(any? #(>= % 10) [1 5 10])
=> true
```

[top](#)

## app/build

```
(app/build name main-file file-map dest-dir)
```

Creates a Venice application archive that can be distributed and executed as a single file.

E.g.:

```
(app/build "test"
  "chart.venice"
  { "chart.venice" "./foo/chart.venice"
    "utils.venice" "./foo/utils.venice" }
  ".")
```

Loading Venice files works relative to the application. You can only load files that are in the app archive. If for instances "chart.venice" in the above example requires "utils.venice" just add (load-file "utils") to "chart.venice".

The app can be run from the command line as:

```
> java -jar venice-1.7.17.jar -app test.zip
```

Or with additional Java libraries (all JARs in 'libs' dir):

```
> java -cp "libs/*" com.github.jlangch.venice.Launcher -app test.zip
```

[top](#)

## app/manifest

```
(app/manifest app)
```

Returns the manifest of a Venice application archive.

[top](#)

## apply

```
(apply f args* coll)
```

Applies f to all arguments composed of args and coll

```
(apply + [1 2 3])
=> 6
```

```
(apply + 1 2 [3 4 5])
=> 15

(apply str [1 2 3 4 5])
=> "12345"

(apply inc [1])
=> 2
```

top

## as->

```
(as-> expr name & forms)
```

Binds name to expr, evaluates the first form in the lexical context of that binding, then binds name to that result, repeating for each successive form, returning the result of the last form. This allows a value to thread into any argument position.

; allows to use arbitrary positioning of the argument

```
(as-> [ :foo :bar ] v
      (map name v)
      (first v)
      (str/subs v 1))
=> "oo"
```

; allows the use of if statements in the thread

```
(as-> { :a 1 :b 2 } m
      (update m :a #(+ % 10))
      (if true
          (update m :b #(+ % 10))
          m))
=> { :a 11 :b 12 }
```

If `metadata-map` is supplied, it will become the metadata on the atom. `validate-fn` must be `nil` or a side-effect-free fn of one argument, which will be passed the intended new state on any state change. If the new state is unacceptable, the `validate-fn` should return `false` or throw an exception.

## SEE ALSO

### [deref](#)

Dereferences an atom, a future or a promise object. When applied to an atom, returns its current state. When applied to a future, will ...

### [reset!](#)

Sets the value of an atom or a volatile to `newval` without regard for the current value. Returns `newval`.

### [swap!](#)

Atomically swaps the value of an atom or a volatile to be: (apply `f` `current-value-of-box` `args`). Note that `f` may be called multiple ...

### [compare-and-set!](#)

Atomically sets the value of atom to `newval` if and only if the current value of the atom is identical to `oldval`. Returns `true` if set ...

### [add-watch](#)

Adds a watch function to an agent/atom reference. The watch fn must be a fn of 4 args: a key, the reference, its old-state, its new-state.

### [remove-watch](#)

Removes a watch function from an agent/atom reference.

## bytebuf

(bytebuf x)

Converts x to bytebuf. x can be a bytebuf, a list/vector of longs, or a string

```
(bytebuf [0 1 2])
```

```
=> [0 1 2]
```

```
(bytebuf '(0 1 2))

## bytebuf-allocate

(bytebuf-allocate length)

Allocates a new bytebuf. The values will be all zero.

```
(bytebuf-allocate 20)
```

```
=> [0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0]

## bytebuf-capacity

(bytebuf-capacity buf)

Returns the capacity of a bytebuf.

```
(bytebuf-capacity (bytebuf-allocate 100))
```

```
=> 100
```

## bytebuf-from-string

(bytebuf-from-string s encoding)

Converts a string to a bytebuf using an optional encoding. The encoding defaults to :UTF-8

```
(bytebuf-from-string "abcdef" :UTF-8)
```

```
=> [97 98 99 100 101 102]

## bytebuf-get-byte

```
(bytebuf-get-byte buf)
(bytebuf-get-byte buf pos)
```

Reads a byte from the buffer. Without a pos reads from the current position and increments the position by one. With a position reads the byte from that position.

```
(-> (bytebuf-allocate 4)
    (bytebuf-put-byte! 1)

## bytebuf-get-double

```
(bytebuf-get-double buf)
(bytebuf-get-double buf pos)
```

Reads a double from the buffer. Without a pos reads from the current position and increments the position by eight. With a position reads the double from that position.

```
(-> (bytebuf-allocate 16)
    (bytebuf-put-double! 20.0)
    (bytebuf-put-double! 40.0)
    (bytebuf-get-double 0))
=> 20.0
```

## bytebuf-get-float

```
(bytebuf-get-float buf)
(bytebuf-get-float buf pos)
```

Reads a float from the buffer. Without a pos reads from the current position and increments the position by four. With a position reads the float from that position.

```
(-> (bytebuf-allocate 16)
    (bytebuf-put-float! 20.0)

```

[top](#)

## bytebuf-sub

```
(bytebuf-sub x start) (bytebuf-sub x start end)
```

Returns a byte buffer of the items in buffer from start (inclusive) to end (exclusive). If end is not supplied, defaults to (count bytebuffer)

```
(bytebuf-sub (bytebuf [1 2 3 4 5 6]) 2)
=> [3 4 5 6]

```
(bytebuf-sub (bytebuf [1 2 3 4 5 6]) 4)
=> [5 6]
```

## bytebuf-to-list

```
(bytebuf-to-list buf)
```

Returns the bytebuf as lazy list of integers

```
(doall (bytebuf-to-list (bytebuf [97 98 99])))  
=> (97I 98I 99I)
```

## bytebuf-to-string

```
(bytebuf-to-string buf encoding)
```

Converts a bytebuf to a string using an optional encoding. The encoding defaults to :UTF-8

```
(bytebuf-to-string (bytebuf [97 98 99]) :UTF-8)  
=> "abc"
```

## bytebuf?

```
(bytebuf? x)
```

Returns true if x is a bytebuf

```
(bytebuf? (bytebuf [1 2]))  
=> true
```

```
(bytebuf? [1 2])  
=> false
```

```
(bytebuf? nil)  
=> false
```

## callstack

```
(callstack)
```

Returns the current callstack.

```
(do  
  (defn f1 [x] (f2 x))  
  (defn f2 [x] (f3 x))  
  (defn f3 [x] (f4 x))

## class

```
(class name)
```

Returns the Java class for the given name. Throws an exception if the class is not found.

```
(class :java.util.ArrayList)  
=> class java.util.ArrayList
```

### SEE ALSO

#### [class-of](#)

Returns the Java class of a value.

## comp

(comp f\*)

Takes a set of functions and returns a fn that is the composition of those fns. The returned fn takes a variable number of args, applies the rightmost of fns to the args, the next fn (right-to-left) to the result, etc.

```
((comp str +) 8 8 8)  
=> "24"
```

```
(map (comp - (partial + 3) (partial * 2)) [1 2 3 4])  
=> (-5 -7 -9 -11)

## compare

(compare x y)

Comparator. Returns -1, 0, or 1 when x is logically 'less than', 'equal to', or 'greater than' y. For list and vectors the longer sequence is always 'greater' regardless of its contents. For sets and maps only the size of the collection is compared.

```
(compare nil 0)  
=> -1
```

```
(compare 0 nil)
=> 1

(compare 1 0)

## compare-and-set!

```
(compare-and-set! atom oldval newval)
```

Atomically sets the value of atom to newval if and only if the current value of the atom is identical to oldval. Returns true if set happened, else false

```
(do
  (def counter (atom 2))
  (compare-and-set! counter 2 4)
  (deref counter))
=> 4
```

### SEE ALSO

## cond

```
(cond & clauses)
```

Takes a set of test/expr pairs. It evaluates each test one at a time. If a test returns logical true, `cond` evaluates and returns the value of the corresponding expr and doesn't evaluate any of the other tests or exprs. `(cond)` returns `nil`.

```
(let [n 5]
  (cond
    (< n 0) "negative"
    (> n 0) "positive"
    :else "zero"))
=> "positive"
```

## SEE ALSO

```

Takes an expression and a set of test/form pairs. Threads expr (via ->) through each form for which the corresponding test expression is true. Note that, unlike cond branching, cond-> threading does not short circuit after the first true test expression.

It is useful in situations where you want selectively assoc, update, or dissoc something from a map.

## condp

(condp pred expr & clauses)

Takes a binary predicate, an expression, and a set of clauses.

Each clause can take the form of either:

test-expr result-expr

test-expr :>> result-fn

Note :>> is an ordinary keyword.

For each clause, (pred test-expr expr) is evaluated. If it returns logical true, the clause is a match. If a binary clause matches, the result-expr is returned, if a ternary clause matches, its result-fn, which must be a unary function, is called with the result of the predicate as its argument, the result of that call being the return value of condp. A single default expression can follow the clauses, and its value will be returned if no clause matches. If no default expression is provided and no clause matches, a VncException is thrown.

```
(condp some [1 2 3 4]
  #{0 6 7} :>> inc
  #{4 5 9} :>> dec
  #{1 2 3} :>> #(* % 10))
=> 3

## crypt/decrypt

(crypt/decrypt algorithm passphrase & options)

Returns a new function to decrypt a string or a bytearray given the algorithm and passphrase. If a string is passed it is base64 decoded, decrypted, and returned as string. If a bytearray is passed the decrypted bytearray is returned.

Supported algorithms: "DES", "3DES", "AES256"

Options:

:url-safe enabled

The boolean option directs the base64 decoder to decode standard or URL safe base64 encoded strings.

If enabled (true) the base64 decoder will convert '-' and '\_' characters back to '+' and '/' before decoding.

Defaults to false.

```
(do

## crypt/encrypt

(crypt/encrypt algorithm passphrase & options)

Returns a new function to encrypt a string or a bytearray given the algorithm and passphrase. If a string is passed it is encrypted and returned as a base64 encoded string. If a bytearray is passed the encrypted bytearray is returned.

Supported algorithms: "DES", "3DES", "AES256"

Options:

:url-safe enabled

The boolean option directs the base64 encoder to emit standard or URL safe base64 encoded strings.

If enabled (true) the base64 encoder will emit '-' and '\_' instead of the usual '+' and '/' characters.

Defaults to false.  
Note: no padding is added when encoding using the  
URL-safe alphabet.

```

## csv/write-str

(`csv/write-str` records & options)

Writes data to a string in CSV format.

Options:

- `:separator val` - e.g. `","`, defaults to a comma
- `:quote val` - e.g. `"'"`, defaults to a double quote
- `:newline val` (`:lf` (default) or `:cr+lf`)

```
(csv/write-str [[1 "AC" false] [2 "WS" true]])
=> "1,AC,false\n2,WS,true"

(csv/write-str [[1 "AC" false] [2 "WS, '-1'" true]]
  :quote "'"
  :separator ","
  :newline :cr+lf)
=> "1,AC,false\r\n2,'WS, '-1'',true"
```

## current-time-millis

(`current-time-millis`)

Returns the current time in milliseconds.

```
(current-time-millis)
=> 1610018185037
```

### SEE ALSO

[nano-time](#)

Returns the current value of the running Java Virtual Machine's high-resolution time source, in nanoseconds.

[top](#)

## cycle

```
(cycle coll)
```

Returns a lazy (infinite!) sequence of repetitions of the items in coll.

```
(doall (take 5 (cycle [1 2])))  
=> (1 2 1 2 1)
```

## SEE ALSO

### [repeat](#)

Returns a lazy sequence of x values or a collection with the value x repeated n times.

### [repeatedly](#)

Takes a function of no args, presumably with side effects, and returns a collection of n calls to it

### [dotimes](#)

Repeatedly executes body with name bound to integers from 0 through n-1.

### [constantly](#)

Returns a function that takes any number of arguments and returns always the value x.

[top](#)

## decimal

(decimal x) (decimal x scale rounding-mode)

Converts to decimal. rounding-mode is one of (:CEILING, :DOWN, :FLOOR, :HALF\_DOWN, :HALF\_EVEN, :HALF\_UP, :UNNECESSARY, :UP)

```
(decimal 2)
=> 2M
```

```
(decimal 2 3 :HALF_UP)

Returns true if a value has been produced for a promise, delay, or future.

## deref

```
(deref x)
(deref x timeout-ms timeout-val)
```

Dereferences an atom, a future or a promise object. When applied to an atom, returns its current state. When applied to a future, will block if computation not complete. The variant taking a timeout can be used for futures and will return timeout-val if the timeout (in milliseconds) is reached before a value is available. ### SEE ALSO

[true?](#)

Returns true if x is true, false otherwise

[not](#)

Returns true if x is logical false, false otherwise.

[top](#)

## filter

```
(filter predicate coll)
```

Returns a collection of the items in coll for which (predicate item) returns logical true. Returns a transducer when no collection is provided.

```
(filter even? [1 2 3 4 5 6 7])  
=> (2 4 6)
```

```
(filter #(even? (val %)) {:a 1 :b 2})

## filter-k

```
(filter-k f map)
```

Returns a map with entries for which the predicate (f key) returns logical true. f is a function with one arguments.

```
(filter-k #(= % :a) {:a 1 :b 2 :c 3})  
=> {:a 1}
```

[top](#)

## filter-kv

```
(filter-kv f map)
```

Returns a map with entries for which the predicate (f key value) returns logical true. f is a function with two arguments.

```
(filter-kv (fn [k v] (= k :a)) {:a 1 :b 2 :c 3})  
=> {:a 1}
```

```
(filter-kv (fn [k v] (= v 2)) {:a 1 :b 2 :c 3})  
=> {:b 2}
```

[top](#)

## find

```
(find map key)
```

Returns the map entry for key, or nil if key not present.

```
(find {:a 1 :b 2} :b)
=> [:b 2]

(find {:a 1 :b 2} :z)
=> nil
```

[top](#)

## flatten

```
(flatten coll)
```

Takes any nested combination of collections (lists, vectors, etc.) and returns their contents as a single, flat sequence. (flatten nil) returns an empty list. Returns a transducer when no collection is provided.

```
(flatten [])
=> []

(flatten [[1 2 3] [4 [5 6]] [7 [8 [9]]]])
=> [1 2 3 4 5 6 7 8 9]

[top](#)

## float-array

```
(float-array coll)
(float-array len)
(float-array len init-val)
```

Returns an array of Java primitive floats containing the contents of `coll` or returns an array with the given length and optional init value

```
(float-array '(1.0 2.0 3.0))
=> [1.0, 2.0, 3.0]

(float-array '(1I 2 3.2 3.56M))

```

[top](#)

## flush

```
(flush)
(flush os)
```

Without `arg` flushes the output stream that is the current value of `*out*`. With `arg` flushes the passed output stream.  
Returns `nil`.

```
(flush)
=> nil

(flush *out*)
=> nil
```

```
(flush *err*)  
=> nil
```

## fnil

```
(fnil f x)
(fnil f x y)
(fnil f x y z)
```

Takes a function f, and returns a function that calls f, replacing a nil first argument to f with the supplied value x. Higher arity versions can replace arguments in the second and third positions (y, z). Note that the function f can take any number of arguments, not just the one(s) being nil-patched.

## halt-when

```
(halt-when pred)
(halt-when pred retf)
```

Returns a transducer that ends transduction when pred returns true for an input. When retf is supplied it must be a fn of 2 arguments - it will be passed the (completed) result so far and the input that triggered the predicate, and its return value (if it does not throw an exception) will be the return value of the transducer. If retf is not supplied, the input that triggered the predicate will be returned. If the predicate never returns true the transduction is unaffected.

## io/download

`(io/download uri & options)`

Downloads the content from the `uri` and reads it as text (string) or binary (bytebuf).

Options:

- `:binary true/false` - e.g `:binary true`, defaults to `false`
- `:user-agent agent` - e.g `:user-agent "Mozilla"`, defaults to `nil`
- `:encoding enc` - e.g `:encoding :utf-8`, defaults to `:utf-8`
- `:conn-timeout val` - e.g `:conn-timeout 10000`,  
connection timeout in milli seconds.  
`0` is interpreted as an infinite timeout.
- `:read-timeout val` - e.g `:read-timeout 10000`,  
read timeout in milli seconds.  
`0` is interpreted as an infinite timeout.
- `:progress-fn fn` - a progress function that takes 2 args
  - `[1] progress (0..100%)`
  - `[2] status {:start :progress :end :failed}`

If the server returns a 403 (access denied) sending a user-agent may fool the website.

```
(io/zip-file options* zip-file & files)
```

Zips files and directories recursively. Does not zip hidden files and does not follow symbolic links. The zip-file may be a file, a string (file path) or an OutputStream.

Options:

- :filter-fn fn - a predicate function that filters the files to be added to the zip.
- :mapper-fn fn - a mapper function that can map the file content of a file before it gets zipped. Returns nil or a :java.io.InputStream. The real file is used when nil is returned.
- :silent true/false - if false prints the added entries to \*out\*, defaults to false

Example:

```
venice> (io/zip-file :silent false "test.zip" "dirA" "dirB")
```

Output:

```
adding: dirA/
adding: dirA/a1.png
adding: dirA/a2.png

## json/read-str

(json/read-str s & options)

Reads a JSON string and returns it as a Venice datatype.

Options are:

**:key-fn** fn

Single-argument function called on JSON property names; return value will replace the property names in the output. Default is 'identity', use 'keyword' to get keyword properties.

**:value-fn** fn

Function to transform values in JSON objects in the output. For each JSON property, value-fn is called with two arguments: the property name (transformed by key-fn) and the value. The return value of value-fn will replace the value in the output. The default value-fn returns the value unchanged.

**:decimal** boolean

If true use BigDecimal for decimal numbers instead of Double. Default is false.

```
(json/read-str (json/write-str {:a 100 :b 100}))

## load-file

```
(load-file file)
(load-file file force)
```

Sequentially read and evaluate the set of forms contained in the file.

If the file can not be found on the global load paths and the sandbox permits the file is either loaded from the current working directory if it has a relative path or it is loaded from its absolute path.

With 'force' set to false (the default) the file is only loaded once and then served from a cache. With 'force' set to true it is always loaded physically.

The function is restricted to load files with the extension '.venice'. If the file extension is missing '.venice' will be implicitly added.

Returns 'true' if the file has been successfully loaded and 'false' if the file has been already loaded. Throws an exception on loading error.

```

## load-module

```
(load-module m)
(load-module m force)
```

Loads a Venice predefined extension module.

Returns 'true' if the module has been successfully loaded and 'false' if the module has been already loaded.

Throws an exception on loading error.

```
(load-module :math)
=> :math

(do
  (load-module :math)

## load-resource

```
(load-resource res)
```

Loads a resource from the application archive or the `*load-path*`. Returns a `bytebuffer` or `nil` if the resource is not found in any of the two locations.

## load-string

```
(load-string s)
```

Sequentially read and evaluate the set of forms contained in the string.

```

## locking

```
(locking x & exprs)
```

Executes `exprs` in an implicit `do`, while holding the monitor of `x`.

Will release the monitor of `x` in all circumstances.

Locking operates like the `synchronized` keyword in Java.

```
(do

Returns an array of Java primitive longs containing the contents of coll or returns an array with the given length and optional init value

```
(long-array '(1 2 3))
=> [1, 2, 3]

(long-array '(1I 2 3.2 3.56M))

## maven/download

(maven/download artefact options\*)

Downloads an artefact in the format 'group-id:artefact-id:version' from a Maven repository. Can download any combination of the jar, sources, or pom artefacts to a directory.

Options:

:jar {true,false}	download the jar, defaults to true
:sources {true,false}	download the sources, defaults to false
:pom {true,false}	download the pom, defaults to false
:dir path	download dir, defaults to "."
:repo maven-repo	a maven repo, defaults to "https://repo1.maven.org/maven2"
:silent {true,false}	if silent is true does not show a progress bar, defaults to true

## partition

```
(partition n coll)  
(partition n step coll)  
(partition n step padcoll coll)
```

Returns a collection of lists of `n` items each, at offsets `step` apart. If `step` is not supplied, defaults to `n`, i. e. the partitions do not overlap. If a `padcoll` collection is supplied, use its elements as necessary to complete last partition upto `n` items. In case there are not enough padding elements, return a partition with less than `n` items. `padcoll` may be a lazy sequence

## prof

(prof opts)

Controls the code profiling. See the companion functions/macros `'dorun'` and `'perf'`. The `perf` macro is built on `prof` and `dorun` and provides all for simple Venice profiling.

The profiler reports a function's elapsed time as `"time with children"`!

Profiling recursive functions:

Because the profiler reports `"time with children"` and accumulates the elapsed time across all recursive calls the resulting time for a particular recursive function is higher than the effective time.

```
(do
  (prof :on)    ; turn profiler on
  (prof :off)   ; turn profiler off
  (prof :status) ; returns the profiler on/off status
  (prof :clear) ; clear profiler data captured so far
  (prof :data)  ; returns the profiler data as map
  (prof :data-formatted) ; returns the profiler data as formatted text
  (prof :data-formatted "Metrics test") ; returns the profiler data as formatted text with a title
  nil)
=> nil
```

## SEE ALSO

### [perf](#)

Performance test with the given expression.

### [time](#)

Evaluates `expr` and prints the time it took. Returns the value of `expr`.

[top](#)

## promise

(promise)

Returns a promise object that can be read with `deref`, and `set`, once only, with `deliver`. Calls to `deref` prior to delivery will block, unless the variant of `deref` with timeout is used. All subsequent derefs will return the same delivered value without blocking.

```
(do
  (def p (promise))
  (deliver p 10)
  (deliver p 20)
  @p)
=> 10

(do

Proxifies a Java interface to be passed as a Callback object to Java functions. The interface's methods are implemented by Venice functions.

The dynamic invocation handler takes care that the methods are called in the context of Venice sandbox even if the Java method that invokes the callback methods is running in another thread.

```

## quasiquote

(quasiquote form)

Quasi quotes also called syntax quotes (a backquote) suppress evaluation of the form that follows it and all the nested forms.

unquote:

It is possible to unquote part of the form that is quoted with ``~``. Unquoting allows you to evaluate parts of the syntax quoted expression.

unquote-splicing:

Unquote evaluates to a collection of values and inserts the collection into the quoted form. But sometimes you want to unquote a list and insert its elements (not the list) inside the quoted form. This is where ``~@`` (unquote-splicing) comes to rescue.

```
(quasiquote (16 17 (inc 17)))  
=> (16 17 (inc 17))
```

```
`(16 17 (inc 17))  
=> (16 17 (inc 17))
```

```
`(16 17 ~(inc 17))  
=> (16 17 18)
```

```
`(16 17 ~(map inc [16 17]))  
=> (16 17 (17 18))
```

```
`(16 17 ~@(map inc [16 17]))

=> 50005000
```

## SEE ALSO

### [loop](#)

Evaluates the exprs and binds the bindings. Creates a recursion point with the bindings.

[top](#)

## reduce

```
(reduce f coll)
(reduce f val coll)
```

`f` should be a function of 2 arguments. If `val` is not supplied, returns the result of applying `f` to the first 2 items in `coll`, then applying `f` to that result and the 3rd item, etc. If `coll` contains no items, `f` must accept no arguments as well, and `reduce` returns the result of calling `f` with no arguments. If `coll` has only 1 item, it is returned and `f` is not called. If `val` is supplied, returns the result of applying `f` to `val` and the first item in `coll`, then applying `f` to that result and the 2nd item, etc. If `coll` contains no items, returns `val` and `f` is not called.

```
(reduce (fn [x y] (+ x y)) [1 2 3 4 5 6 7])
=> 28

(reduce (fn [x y] (+ x y)) 10 [1 2 3 4 5 6 7])

#### [filter](#)

Returns a collection of the items in `coll` for which `(predicate item)` returns logical true. Returns a transducer when no collection is provided.

[top](#)

## reduce-kv

```
(reduce-kv f init coll)
```

Reduces an associative collection. `f` should be a function of 3 arguments. Returns the result of applying `f` to `init`, the first key and the first value in `coll`, then applying `f` to that result and the 2nd key and value, etc. If `coll` contains no entries, returns `init` and `f` is not called. Note that `reduce-kv` is supported on vectors, where the keys will be the ordinals.

```
(reduce-kv (fn [m k v] (assoc m v k))
           {}
           {:a 1 :b 2 :c 3})
=> {1 :a 2 :b 3 :c}

            :c {:col :blue :len 30}})
=> {:a :red :b :green :c :blue}
```

## reduced

```
(reduced x)
```

Wraps x in a way such that a reduce will terminate with the value x.

## reduced?

```
(reduced? x)
```

Returns true if x is the result of a call to reduced.

## regex/count

```
(regex/count matcher)
```

Returns the matcher's group count.

```
(let [p (regex/pattern "[0-9]+(.*)")

## regex/matches

```
(regex/matches pattern str)
```

Returns the matches, if any, for the matcher with the pattern of a string, using `java.util.regex.Matcher.matches()`.

If the matcher's pattern matches the entire region sequence returns a list with the entire region sequence and the matched groups otherwise returns an empty list.

Returns matching info as meta data on the region and the groups:

Region meta data:

```
:start      start pos of the overall group
:end        end pos of the overall group
:group-count the number of matched elements groups

## remove

```
(remove predicate coll)
```

Returns a collection of the items in `coll` for which `(predicate item)` returns logical false. Returns a transducer when no collection is provided.

```
(remove even? [1 2 3 4 5 6 7])
=> (1 3 5 7)

(remove #{3 5} '(1 3 5 7 9))

```

### SEE ALSO

[agent](#)

Creates and returns an agent with an initial value of state and zero or more options.

[top](#)

## repeat

```
(repeat x)
(repeat n x)
```

Returns a lazy sequence of x values or a collection with the value x repeated n times.

```
(repeat 3 "hello")
=> ("hello" "hello" "hello")

(repeat 5 [1 2])
=> ([1 2] [1 2] [1 2] [1 2] [1 2])

## replace

```
(replace smap coll)
```

Given a map of replacement pairs and a collection, returns a collection with any elements that are a key in smap replaced with the corresponding value in smap.

```
(replace {2 :two, 4 :four} [4 2 3 4 5 6 2])  
=> [:four :two 3 :four 5 6 :two]
```

```
(replace {2 :two, 4 :four} #{1 2 3 4 5})

## set-error-handler!

```
(set-error-handler! agent handler-fn)
```

Sets the error-handler of an agent to handler-fn. If an action being run by the agent throws an exception handler-fn will be called with two arguments: the agent and the exception.

```
(do
  (def x (agent 100))
  (defn err-handler-fn [ag ex]

## sh

(sh & args)

Passes the given strings to Runtime.exec() to launch a sub-process.

Options are

```
:in      may be given followed by input source as InputStream,  
         Reader, File, ByteBuf, or String, to be fed to the  
         sub-process's stdin.
```

**:in-enc** option may be given followed by a String, used as a character encoding name (for example "UTF-8" or "ISO-8859-1") to convert the input string specified by the **:in** option to the sub-process's stdin. Defaults to UTF-8. If the **:in** option provides a byte array, then the bytes are passed unencoded, and this option is ignored.

**:out-enc** option may be given followed by **:bytes** or a String. If a String is given, it will be used as a character encoding name (for example "UTF-8" or "ISO-8859-1") to convert the sub-process's stdout to a String which is returned. If **:bytes** is given, the sub-process's stdout will be stored in a Bytebuf and returned. Defaults to UTF-8.

**:out-fn** a function with a single string argument that receives line by line from the process' stdout. If passed the **:out** value in the return map will be empty.

**:err-fn** a function with a single string argument that receives line by line from the process' stderr. If passed the **:err** value in the return map will be empty.

**:env** override the process env with a map.

**:dir** override the process dir with a String or java.io.File.

**:throw-ex** If true throw an exception if the exit code is not equal to zero, if false returns the exit code. Defaults to false. It's recommended to use (with-sh-throw (sh "foo")) instead.

You can bind **:env**, **:dir** for multiple operations using **with-sh-env** or **with-sh-dir**. **with-sh-throw** is binds **:throw-ex** as true.

sh returns a map of

**:exit** => sub-process's exit code  
**:out** => sub-process's stdout (as Bytebuf or String)  
**:err** => sub-process's stderr (String via platform default encoding)

```
(str/index-of "abcdefabc" "ab")  
=> 0
```

[top](#)

## str/join

```
(str/join coll)  
(str/join separator coll)
```

Joins all elements in coll separated by an optional separator.

```
(str/join [1 2 3])  
=> "123"
```

```
(str/join "-" [1 2 3])  
=> "1-2-3"

Return last index of value (string or char) in s, optionally searching backward from from-index. Return nil if value not found.

```
(str/last-index-of "abcdefabc" "ab")  
=> 6
```

## str/letter?

```
(str/letter? s)
```

True if `s` is a single char string and the char is a letter. Defined by Java `Character.isLetter(ch)`.

```
(str/letter? (char "x"))  
=> true
```

```
(str/letter? "x")

=> true
```

## str/lorem-ipsum

```
(str/lorem-ipsum & options)
```

Creates an arbitrary length Lorem Ipsum text.

Options:

- :chars `n` - returns `n` characters (limited to 1000000)
- :paragraphs `n` - returns `n` paragraphs (limited to 100)

```
(str/lorem-ipsum :chars 250)

## str/lower-case

```
(str/lower-case s)
(str/lower-case locale s)
```

Converts s to lowercase

```
(str/lower-case "aBcDeF")
=> "abcdef"

(str/lower-case (. :java.util.Locale :new "de" "DE") "aBcDeF")
=> "abcdef"

(str/lower-case (. :java.util.Locale :GERMANY) "aBcDeF")

(str/lower-case (. :java.util.Locale :new "de" "CH") "aBcDeF")
=> "abcdef"

(str/lower-case [ "de" ] "aBcDeF")
=> "abcdef"

(str/lower-case [ "de" "DE" ] "aBcDeF")
=> "abcdef"

(str/lower-case [ "de" "DE" ] "aBcDeF")
=> "abcdef"
```

## str/lower-case?

```
(str/lower-case? s)
```

True if s is a single char string and the char is a lower case char. Defined by Java Character.isLowerCase(ch).

```
(str/lower-case? (char "x"))
=> true

(str/lower-case? "x")
=> true
```

## str/pos

```
(str/pos s pos)
```

Returns the 0 based row/column position within a string based on absolute character position. Returns a map with the keys 'row' and 'col'.

Note: CR & LF count as one each regarding the absolute position.

```
(str/pos "abcdefghij" 4)
=> {:col 4 :row 0}

(str/pos "ab
cdefghij" 6)
=> {:col 3 :row 1}
```

[top](#)

## str/quote

```
(str/quote str q)
(str/quote str start end)
```

Quotes a string.

```
(str/quote "abc" "-")
=> "-abc-"

(str/quote "abc" "<" ">")
=> "<abc>"
```

[top](#)

## str/quoted?

```
(str/quoted? str q)
(str/quoted? str start end)
```

Returns true if the string is quoted.

```
(str/quoted? "-abc-" "-")
=> true

(str/quoted? "<abc>" "<" ">")
=> true
```

[top](#)

## str/repeat

```
(str/repeat s n)
(str/repeat s n sep)
```

Repeats s n times with an optional separator.

```
(str/repeat "abc" 0)
=> ""

(str/repeat "abc" 3)
=> "abcabcab"

(str/repeat "abc" 3 "-")
=> "abc-abc-abc"
```

## str/replace-all

```
(str/replace-all s search replacement)
```

Replaces the all occurrences of search in s. The search arg may be a string or a regex pattern

```
(str/replace-all "abcdefabc" "ab" "__")  
=> "__cdef__c"
```

```
(str/replace-all "a0b01c012d" (regex/pattern "[0-9]+") "_")  
=> "a_b_c_d"
```

## str/replace-first

```
(str/replace-first s search replacement & options)
```

Replaces the first occurrence of search in s. The search arg may be a string or a regex pattern. If the search arg is of type string the options :ignore-case and :nfirst are supported.

Options:

- :ignore-case true/false - e.g :ignore-case true, defaults to false
- :nfirst n - e.g :nfirst 2, defaults to 1

```
(str/replace-first "ab-cd-ef-ab-cd" "ab" "XYZ")  
=> "XYZ-cd-ef-ab-cd"
```

```
(str/replace-first "AB-CD-EF-AB-CD" "ab" "XYZ" :ignore-case true)  
=> "XYZ-CD-EF-AB-CD"
```

```
(str/replace-first "ab-ab-cd-ab-ef-ab-cd" "ab" "XYZ" :nfirst 3)  
=> "XYZ-XYZ-cd-XYZ-ef-ab-cd"
```

```
(str/replace-first "a0b01c012d" (regex/pattern "[0-9]+") "_")  
=> "a_b01c012d"
```

## str/replace-last

```
(str/replace-last s search replacement & options)
```

Replaces the last occurrence of search in s

```
(str/replace-last "abcdefabc" "ab" "XYZ")  
=> "abcdeXYZc"
```

```
(str/replace-last "foo.JPG" ".jpg" ".png" :ignore-case true)  
=> "foo.png"
```

## str/rest

```
(str/rest s)
```

Returns a possibly empty string of the characters after the first.

```
(str/rest "abcdef")  
=> "bcdef"
```

[top](#)

## str/reverse

```
(str/reverse s)
```

Reverses a string

```
(str/reverse "abcdef")  
=> "fedcba"
```

[top](#)

## str/split

```
(str/split s regex)
```

Splits string on a regular expression.

```
(str/split "abc,def,ghi" ",")  
=> ("abc" "def" "ghi")  
  
(str/split "abc , def , ghi" "[ *],[ *]")  
=> ("abc" "def" "ghi")  
  
(str/split "abc,def,ghi" "((?<=,)|(?=,))")  
=> ("abc" ", " "def" ", " "ghi")  
  
(str/split nil ",")  
=> ()
```

[top](#)

## str/split-lines

```
(str/split-lines s)
```

Splits s into lines.

```
(str/split-lines "line1  
line2  
line3")  
=> ("line1" "line2" "line3")
```

## str/starts-with?

```
(str/starts-with? s substr)
```

True if s starts with substr.

```
(str/starts-with? "abc" "ab")  
=> true
```

## str/strip-end

```
(str/strip-end s substr)
```

Removes a substr only if it is at the end of a s, otherwise returns s.

```
(str/strip-end "abcdef" "def")  
=> "abc"
```

```
(str/strip-end "abcdef" "abc")  
=> "abcdef"
```

## str/strip-indent

```
(str/strip-indent s)
```

Strip the indent of a multi-line string. The first line's leading whitespaces define the indent.

```
(str/strip-indent "  line1  
    line2  
    line3")  
=> "line1\n  line2\n  line3"
```

## str/strip-margin

```
(str/strip-margin s)
```

Strips leading whitespaces upto and including the margin '|' from each line in a multi-line string.

```
(str/strip-margin "line1  
|  line2  
|  line3")  
=> "line1\n  line2\n  line3"
```

## str/strip-start

```
(str/strip-start s substr)
```

Removes a substr only if it is at the beginning of a s, otherwise returns s.

```
(str/strip-start "abcdef" "abc")  
=> "def"
```

```
(str/strip-start "abcdef" "def")  
=> "abcdef"
```

## str/subs

```
(str/subs s start)  
(str/subs s start end)
```

Returns the substring of s beginning at start inclusive, and ending at end (defaults to length of string), exclusive.

```
(str/subs "abcdef" 2)  
=> "cdef"
```

```
(str/subs "abcdef" 2 5)  
=> "cde"
```

## str/trim

```
(str/trim s)
```

Trims leading and trailing spaces from s.

```
(str/trim " abc ")  
=> "abc"
```

## str/trim-to-nil

```
(str/trim-to-nil s)
```

Trims leading and trailing spaces from s. Returns nil if the resulting string is empty

```
(str/trim-to-nil "")  
=> nil
```

```
(str/trim-to-nil "  ")
=> nil

(str/trim-to-nil nil)
=> nil

(str/trim-to-nil " abc  ")
=> "abc"
```

[top](#)

## str/truncate

```
(str/truncate s maxlen marker mode*)
```

Truncates a string to the max lenght maxlen and adds the marker if the string needs to be truncated. The marker is added to the start, middle, or end of the string depending on the mode :start, :middle, :end. The mode defaults to :end

```
(str/truncate "abcdefghij" 20 "...")
=> "abcdefghij"

(str/truncate "abcdefghij" 9 "...")
=> "abcdef..."

(str/truncate "abcdefghij" 4 "...")
=> "a..."

(str/truncate "abcdefghij" 7 "... :start")

```

```
(str/upper-case [ "de" "DE" "aBcDeF"])
=> "ABCDEF"
```

top

## str/upper-case?

```
(str/upper-case? s)
```

True if `s` is a single char string and the char is an upper case char. Defined by Java `Character.isUpperCase(ch)`.

```
(str/upper-case? (char "X"))
=> true
```

```
(str/upper-case? "X")
=> true
```

top

## str/valid-email-addr?

```
(str/valid-email-addr? e)
```

Returns true if `e` is a valid email address according to RFC5322, else returns false

```
(str/valid-email-addr? "user@domain.com")
=> true
```

```
(str/valid-email-addr? "user@domain.co.in")

=> true

(str/whitespace? " ")
=> true
```

[top](#)

## string-array

```
(string-array coll)
(string-array len)
(string-array len init-val)
```

Returns an array of Java strings containing the contents of coll or returns an array with the given length and optional init value

```
(string-array '("1" "2" "3"))
=> [1, 2, 3]

(string-array 10)
=> [nil, nil, nil, nil, nil, nil, nil, nil, nil]

=> true

(string? 1)
=> false

(string? nil)
=> false
```

[top](#)

## subvec

```
(subvec v start) (subvec v start end)
```

Returns a vector of the items in vector from start (inclusive) to end (exclusive). If end is not supplied, defaults to (count vector)

```
(subvec [1 2 3 4 5 6] 2)
=> [3 4 5 6]
```

```
(subvec [1 2 3 4 5 6] 2 3)
=> [3]
```

top

## supers

(supers class)

Returns the immediate and indirect superclasses and interfaces of class, if any.

```
(supers :java.util.ArrayList)
=> (:java.util.AbstractList :java.util.AbstractCollection :java.util.List :java.util.Collection :java.lang.
Iterable)
```

top

## supertype

## swap!

(swap! box f & args)

Atomically swaps the value of an atom or a volatile to be: (apply f current-value-of-box args). Note that f may be called multiple times, and thus should be free of side effects. Returns the value that was swapped in.

```
(do
  (def counter (atom 0))
  (swap! counter inc)
  @counter)
=> 1
```

```
(do

Creates and returns an agent with an initial value of state and zero or more options.

### [volatile](#)

Creates a volatile with the initial value x

[top](#)

## symbol

```
(symbol name)
(symbol ns name)
```

Returns a symbol from the given name

```
(symbol "a")
=> a

(symbol "foo" "a")
=> foo/a

(symbol *ns* "a")
=> user/a

(symbol 'a)
=> a

## tail-pos

```
(tail-pos)  
(tail-pos name)
```

Throws a `NotInTailPositionException` if the `expr` is not in tail position otherwise returns `nil`.

Definition:

The tail position is a position which an expression would return a value from. There are no more forms evaluated after the form in the tail position is evaluated.

```
;; in tail position  
(do 1 (tail-pos))  
=> nil  
  
;; not in tail position  
(do (tail-pos) 1)  
=> NotInTailPositionException: Not in tail position

## take

```
(take n coll)
```

Returns a collection of the first `n` items in `coll`, or all items if there are fewer than `n`. Returns a stateful transducer when no collection is provided.

```
(take 3 [1 2 3 4 5])  
=> [1 2 3]  
  
(take 10 [1 2 3 4 5])  
=> [1 2 3 4 5]
```

## thread-id

(thread-id)

Returns the identifier of this Thread. The thread ID is a positive number generated when this thread was created. The thread ID is unique and remains unchanged during its lifetime. When a thread is terminated, this thread ID may be reused.

```
(thread-id)  
=> 1
```

## thread-interrupted

```
(thread-interrupted)
```

Tests whether the current thread has been interrupted. The interrupted status of the thread is cleared by this method. In other words, if this method were to be called twice in succession, the second call would return false (unless the current thread were interrupted again, after the first call had cleared its interrupted status and before the second call had examined it).  
Returns true if the current thread has been interrupted else false.

```

## trampoline

```
(trampoline f)  
(trampoline f & args)
```

trampoline can be used to convert algorithms requiring mutual recursion without stack consumption. Calls f with supplied args, if any. If f returns a fn, calls that fn with no arguments, and continues to repeat, until the return value is not a fn, then returns that non-fn value.

Note that if you want to return a fn as a final value, you must wrap it in some data structure and unpack it after trampoline returns.

```
(do  
  (defn factorial  
    ([n] #(factorial n 1N))  
    ([n acc] (if (< n 2)  
               acc

## transduce

```
(transduce xform f coll)  
(transduce xform f init coll)
```

Reduce with a transformation of a reduction function f (xf). If init is not supplied, (f) will be called to produce it. f should be a reducing step function that accepts both 1 and 2 arguments. Returns the result of applying (the transformed) xf to init and the first item in coll, then applying xf to that result and the 2nd item, etc. If coll contains no items, returns init and f is not called.

### SEE ALSO

[namespace](#)

Returns the namespace string of a symbol, keyword, or function.

[var-get](#)

Returns a var's value.

### [var-name](#)

Returns the name of the var's symbol

### [var-local?](#)

Returns true if the var is local else false

### [var-global?](#)

Returns true if the var is global else false

### [var-thread-local?](#)

Returns true if the var is thread-local else false

[top](#)

## var-thread-local?

```
(var-thread-local? v)
```

Returns true if the var is thread-local else false

```
(binding [x 100]
  (var-local? x))
=> false
```

### SEE ALSO

#### [var-get](#)

Returns a var's value.

#### [var-ns](#)

Returns the namespace of the var's symbol

#### [var-name](#)

Returns the name of the var's symbol

#### [var-local?](#)

Returns true if the var is local else false

#### [var-global?](#)

Returns true if the var is global else false

## vary-meta

```
(vary-meta obj f & args)
```

Returns a copy of the object obj, with (apply f (meta obj) args) as its metadata.

```
(meta (vary-meta [1 2] assoc :a 1))
=> {:a 1 :line 14 :column 28 :file "example"}
```

[top](#)

## vector

```
(vector & items)
```

Creates a new vector containing the items.

```
(vector)
=> []

(vector 1 2 3)
=> [1 2 3]

(vector 1 2 3 [:a :b])
=> [1 2 3 [:a :b]]
```

[top](#)

## vector?

(vector? obj)

Returns true if obj is a vector

```
(vector? (vector 1 2))
=> true

(vector? [1 2])
=> true
```

[top](#)

## version

(version)

Returns the Venice version.

```
(version)
=> "0.0.0"
```

[top](#)

## volatile

(volatile x)

Creates a volatile with the initial value x

```
(do
  (def counter (volatile 0))
  (swap! counter inc)
  (deref counter))
=> 1

(do
  (def counter (volatile 0))
```

```
(reset! counter 9)
@counter
=> 9
```

## SEE ALSO

### [deref](#)

Dereferences an atom, a future or a promise object. When applied to an atom, returns its current state. When applied to a future, will ...

### [reset!](#)

Sets the value of an atom or a volatile to newval without regard for the current value. Returns newval.

### [swap!](#)

Atomically swaps the value of an atom or a volatile to be: (apply f current-value-of-box args). Note that f may be called multiple ...

## volatile?

```
(volatile? x)
```

Returns true if x is a volatile, otherwise false

```
(do
  (def counter (volatile 0))
  (volatile? counter))
=> true
```

## when

```
(when test & body)
```

Evaluates test. If logical true, evaluates body in an implicit do.

```
(when (== 1 1) true)
=> true
```

## SEE ALSO

### [when-not](#)

Evaluates test. If logical false, evaluates body in an implicit do.

### [when-let](#)

bindings is a vector with 2 elements: binding-form test.

### [if](#)

Evaluates test. If logical true, evaluates and returns then expression, otherwise else expression, if supplied, else nil.

### [if-not](#)

Evaluates test. If logical false, evaluates and returns then expression, otherwise else expression, if supplied, else nil.

### [if-let](#)

bindings is a vector with 2 elements: binding-form test.

top

## when-let

```
(when-let bindings & body)
```

bindings is a vector with 2 elements: binding-form test.

If test is true, evaluates the body expressions with binding-form bound to the value of test, if not, yields nil

```
(when-let [value (* 100 2)]  
  (str "The expression is true. value=" value))  
=> "The expression is true. value=200"
```

### SEE ALSO

[if-let](#)

bindings is a vector with 2 elements: binding-form test.

[let](#)

Evaluates the expressions and binds the values to symbols in the new local context.

[top](#)

## when-not

```
(when-not test & body)
```

Evaluates test. If logical false, evaluates body in an implicit do.

```
(when-not (== 1 2) true)  
=> true
```

### SEE ALSO

[when](#)

Evaluates test. If logical true, evaluates body in an implicit do.

[when-let](#)

bindings is a vector with 2 elements: binding-form test.

[if](#)

Evaluates test. If logical true, evaluates and returns then expression, otherwise else expression, if supplied, else nil.

## while

```
(while test & body)
```

Repeatedly executes body while test expression is true. Presumes some side-effect will cause test to become false/nil. Returns nil.

```
(do
  (def a (atom 5))
  (while (pos? @a)
    (println @a)
    (swap! a dec)))

## with-err-str

(with-err-str & forms)

Evaluates `exprs` in a context in which `*err*` is bound to a capturing output stream. Returns the string created by any nested printing calls. 'with-err-str' can be nested.

```
(with-err-str (println *err* "a string"))
=> "a string\n"
```

### SEE ALSO

[with-out-str](#)

## with-sh-dir

```
(with-sh-dir dir & forms)
```

Sets the directory for use with sh, see sh for details.

```
(with-sh-dir "/tmp" (sh "ls" "-l"))
```

### SEE ALSO

[with-sh-env](#)

Sets the environment for use with sh, see sh for details.

## with-sh-env

```
(with-sh-env env & forms)
```

Sets the environment for use with sh, see sh for details.

```
(with-sh-env {"NAME" "foo"} (sh "ls" "-l"))
```

### SEE ALSO

[with-sh-dir](#)

Sets the directory for use with sh, see sh for details.

## with-sh-throw

```
(with-sh-throw forms)
```

If true throws an exception if the spawned shell process returns an exit code other than 0. If false return the exit code. Defaults to false. For use with sh, see sh for details. 'with-sh-throw' can be nested.

```
(with-sh-throw (sh "ls" "-l"))
```

## xml/children

```
(xml/children nodes)
```

Returns the children of the XML nodes collection

```
(do
  (load-module :xml)
  (xml/children
```

```
(list (xml/parse-str "<a><b>B</b></a>"))))
=> ({:content ["B"] :tag "b"})
```

[top](#)

## xml/parse

```
(xml/parse s)
(xml/parse s handler)
```

Parses and loads the XML from the source `s` with the parser `XMLHandler` handler. The source may be an `InputSource`, an `InputStream`, a `File`, or a string describing an URI. Returns a tree of XML element maps with the keys `:tag`, `:attrs`, and `:content`.

[top](#)

## xml/parse-str

```
(xml/parse-str s)
(xml/parse-str s handler)
```

Parses an XML from the string `s`. Returns a tree of XML element maps with the keys `:tag`, `:attrs`, and `:content`.

```
(do
  (load-module :xml)
  (xml/parse-str "<a><b>B</b></a>"))
=> {:content [{:content ["B"] :tag "b"}] :tag "a"}

## xml/path->

```
(xml/path-> path nodes)
```

Applies the path to a node or a collection of nodes

```
(do
  (load-module :xml)
  (let [nodes (xml/parse-str "<a><b><c>C</c></b></a>")
        path [(xml/tag= "b")

    (xml/path-> path nodes)))
=> "C"
```

[top](#)

## xml/text

```
(xml/text nodes)
```

Returns a list of text contents of the XML nodes collection

```
(do
  (load-module :xml)
  (let [nodes (xml/parse-str "<a><b>B</b></a>")
        path [(xml/tag= "b")
               xml/text]]
    (xml/path-> path nodes)))
=> ("B")

## zero?

(zero? x)

Returns true if x zero else false

```
(zero? 0)
=> true
```

```
(zero? 2)
=> false
```

```
(zero? (int 0))
=> true
```

```
(zero? 0.0)
=> true
```

```
(zero? 0.0M)
=> true
```

## zipmap

(zipmap keys vals)

Returns a map with the keys mapped to the corresponding vals.

To create a list of tuples from two or more lists use  
(map list '(1 2 3) '(4 5 6)).

```
(zipmap [:a :b :c :d :e] [1 2 3 4 5])
=> {:a 1 :b 2 :c 3 :d 4 :e 5}
```

```
(zipmap [:a :b :c] [1 2 3 4 5])
=> {:a 1 :b 2 :c 3}
```

[top](#)

Creates a hash map.

```
{:a 10 :b 20}  
=> {:a 10 :b 20}
```
